# UNDERSTANDING LUNG CANCER

Lung cancer is a serious condition where abnormal cells multiply uncontrollably in the lungs, forming tumors that interfere with normal lung function. It can begin in any part of the lungs and may spread to other organs. Early detection and proper treatment are crucial for improving survival rates and overall patient outcomes.

# COMMON CAUSES

- Smoking
- Air pollution
- Exposure to toxins
- Genetic factors

# TYPES OF LUNG CANCER

- Non-Small Cell Lung Cancer (NSCLC) – Most common
- Small Cell Lung Cancer (SCLC)
  - More aggressive

Sohna Road, Gurgaon 122018

A portrait of a male doctor with dark hair and a beard, wearing round-rimmed glasses and a light blue medical coat over a white shirt. A stethoscope hangs around his neck. He is smiling and looking down at a dark-colored tablet he is holding with both hands. The background is a soft-focus indoor setting.
