

Targeted Therapy Cost in India

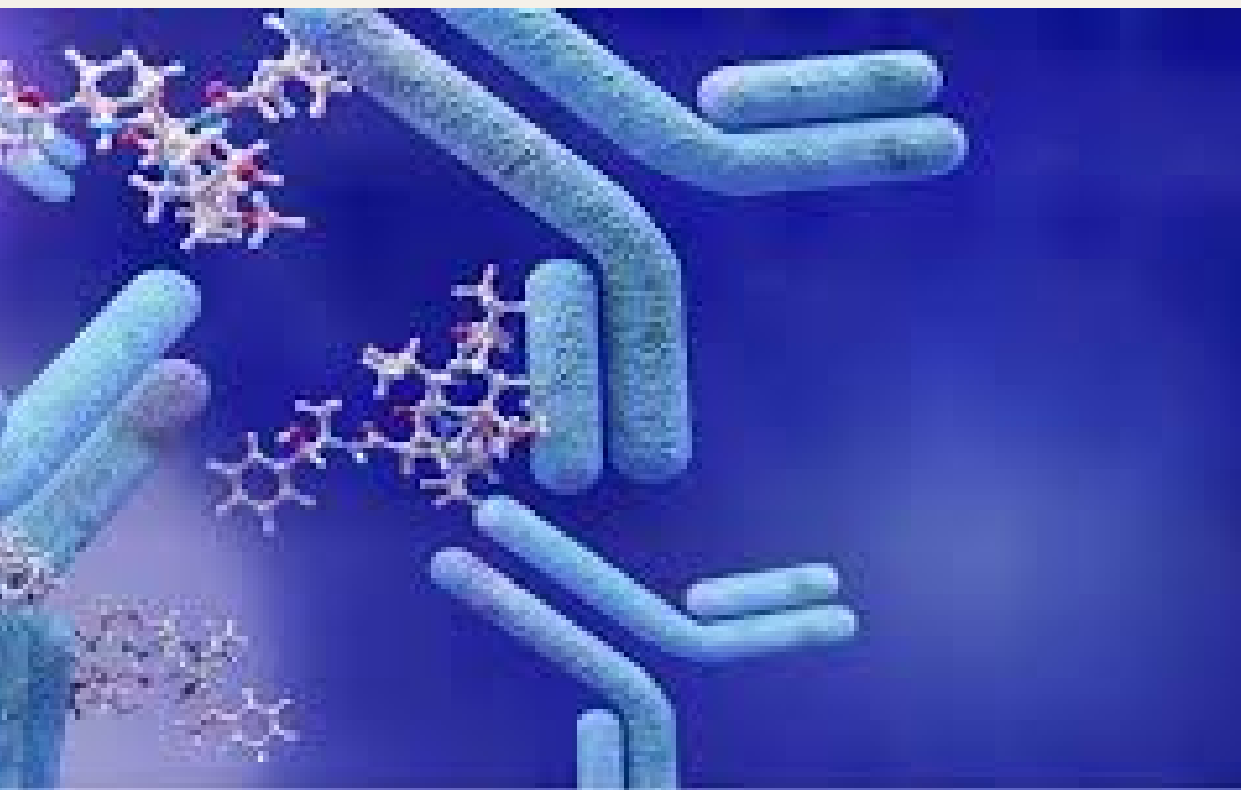

WHAT IS TARGETED THERAPY?

Targeted therapy is a cancer treatment that precisely attacks cancer cells by focusing on specific genes or proteins, minimizing harm to healthy cells. Unlike chemotherapy, it blocks the growth and spread of cancer by targeting key molecules involved in tumor development.

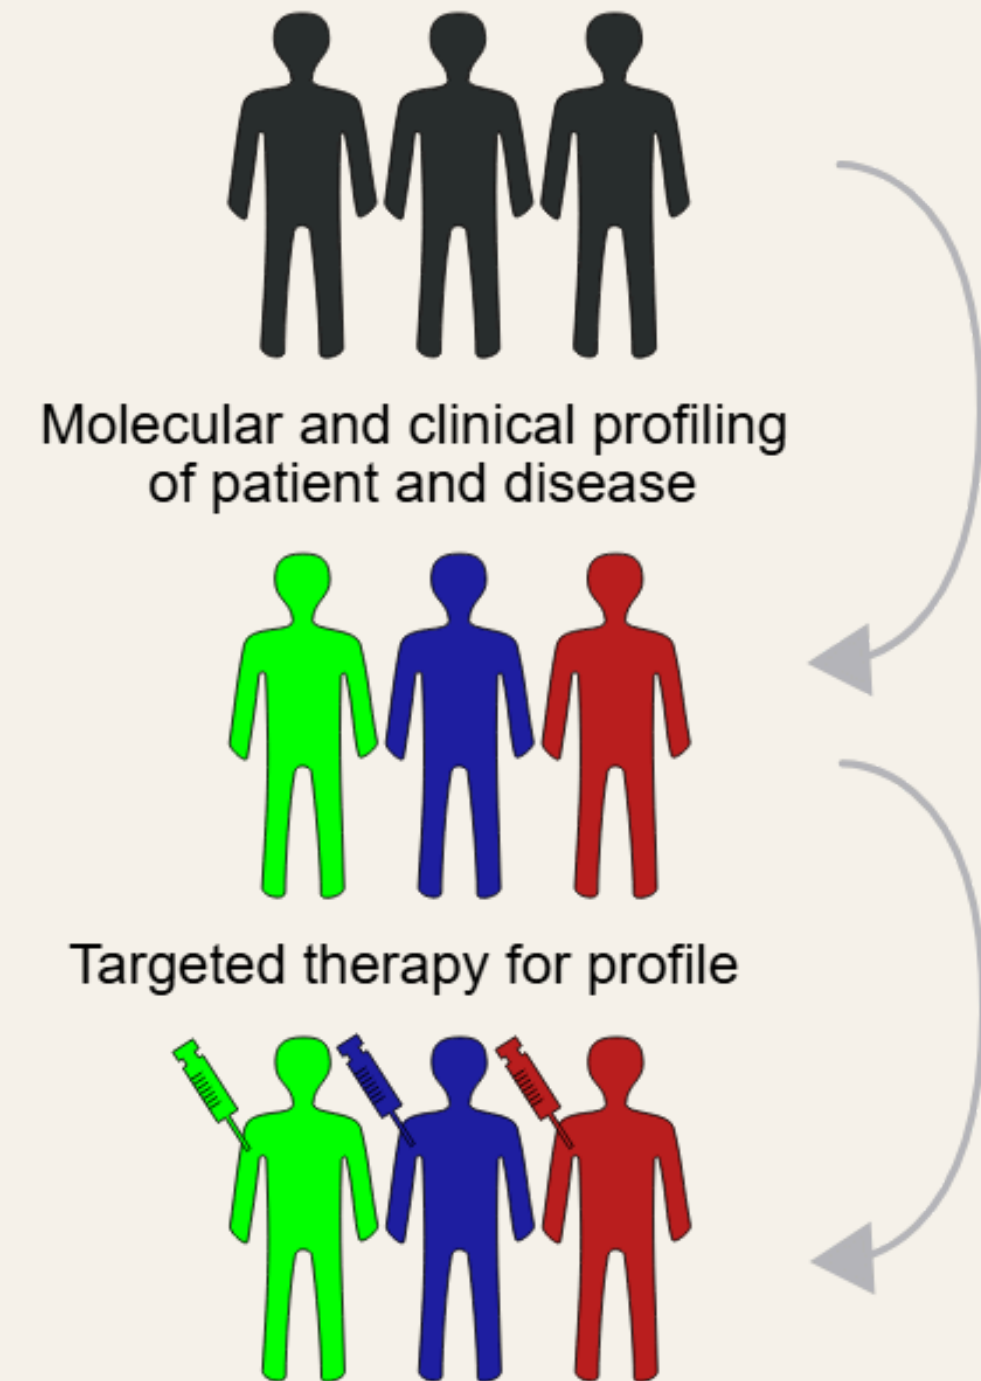

Affordable targeted therapy cost in India starts at approximately 4,200 USD. Compared to other countries, treatment costs in India are significantly lower, while the quality of medical care and services matches global standards—even excluding travel, accommodation, and food expenses.

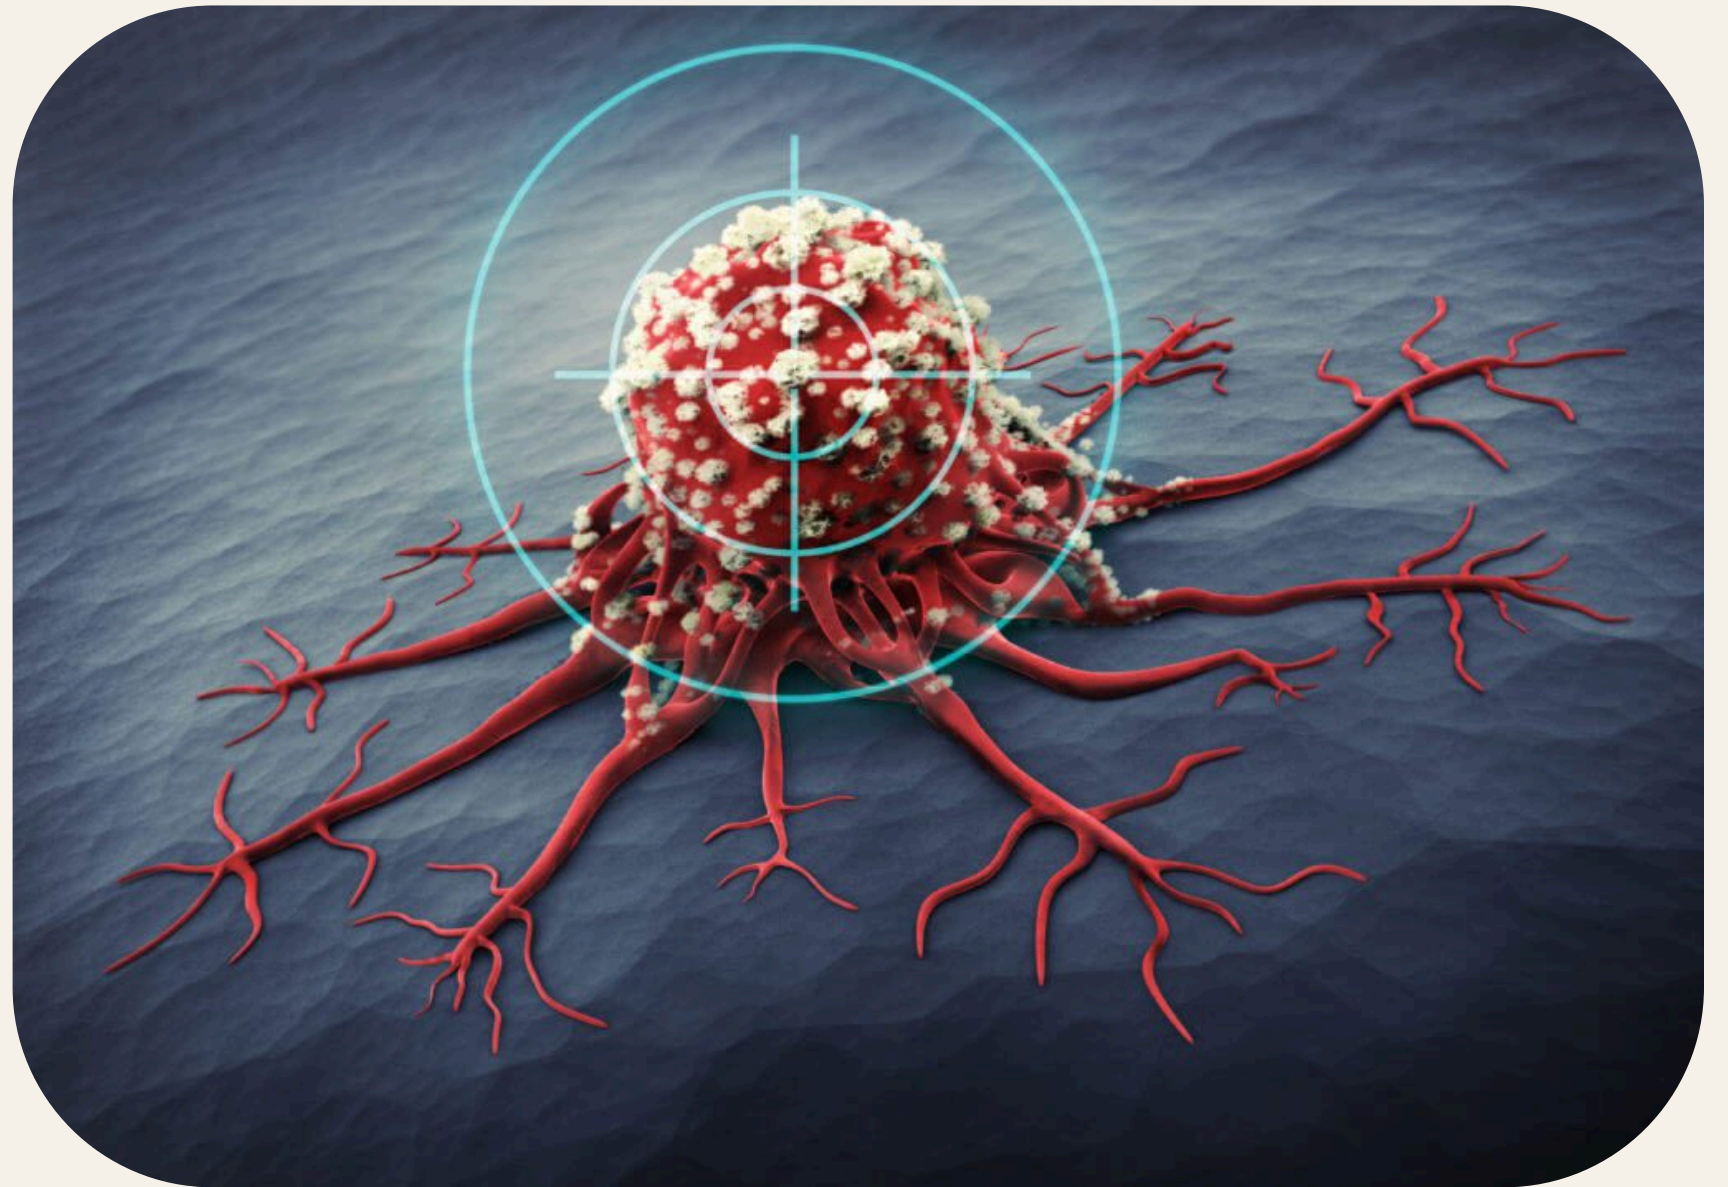

Types of Targeted Therapy:

- Monoclonal Antibodies
- Small-Molecule Medications

Benefits of Targeted Therapy

- Targets specific cancer cells
- Causes fewer side effects
- Effective for cancers with known genetic mutations
- Slows or stops tumor growth
- Helps prevent cancer spread
- Useful when other treatments fail
