

Treatment Options for Multiple Myeloma & Lymphoma

What is Multiple Myeloma?

- A type of blood cancer affecting plasma cells in bone marrow.
- Abnormal plasma cells multiply and interfere with normal blood production.
- Leads to bone damage, kidney problems, and weakened immunity.

Symptoms of Multiple Myeloma

- Frequent infections
- Bone pain or fractures
- Fatigue and weakness
- Kidney-related issues
- Low blood counts (anemia)

Types of Multiple Myeloma

- Smoldering Myeloma – early stage, no symptoms yet.
- Active Myeloma – requires immediate treatment.
- Relapsed/Refractory Myeloma – disease returns after treatment.

Treatment Options in India

- Chemotherapy – kills cancer cells.
- Targeted Therapy – attacks specific myeloma cells.
- Immunotherapy – boosts body's immune response.
- Radiation Therapy – controls bone pain/damage.
- Bone Marrow Transplant (BMT) – replaces diseased cells with healthy stem cells
